

Lift tables

Mobile and stationary lift tables, semi-electric or manually operation

Lift tables facilitate work when order picking, or in production at assembly lines and production lines. Lift tables are basically categorised into stationary and mobile lift tables, which again either have a manual or electric lift function. Stationary lift tables are used primarily in industrial production, where they are firmly integrated into production processes. Mobile lift tables, however, have more flexible uses and are for example ideally suited to order picking in warehouses. All HanseLifter lift tables are of high quality and come equipped with all safety devices. Each lift table is supplied with an operating manual. This should be read thoroughly before the lift table is put into operation.
